UTC ESSAY TIME CAPSULE

If I was making a technology time capsule I would put an IPOD, a WII, an Xbox 360 and some other new stuff. A technology time capsule is something that you put technology of your time in and bury it for people in the future to find. The reason I would put a WII, XBOX, and IPOD is because they are fairly present-day games. Some other things I would put in my time capsule would be a cell phone and a PS3. I would not put a typewriter or an Atari in my time capsule. An Atari is an old gaming system that plugged directly into your TV and was played by using a joystick. The typewriter is a machine that had a key board just like a computer but printed as you pressed letters on the keyboard and there was no spell check.

If I was going to bury a time capsule I would bury it in an active place where someone in the future would find it. I would put my time capsule by a utility pole, as long as I had permission from the utility company. A utility pole is a pole with wire and other equipment on it.

My capsule would be made of metal. I would either find a metal casing of some sort or get my dad to make me one. The reason I would use metal would be because metal is the best material I can think of to hold up under the circumstances of nature. Wood would rot and glass would break. My time capsule would be about 2 ft long and 1 ft across.

If I was going to bury a technology time capsule I would bury it about 1 and ½ feet under ground. At that depth most dogs would not be able to smell it and would not dig it up. But at only 1 and ½ feet there is a real good chance someone will find it.
