

If I were the technology assistant for the President of the United States, I would have many ideas of building a GPS system for finding lost dogs. It will know how to find your dog. If your dog it is following you, the GPS will know. The GPS can find places and people and animals. The GPS is so smart they can have the dog's name or the people's name . There are so many GPS systems that people have in their cars or homes, but most people will have one. The GPS will also have a phone to call people when their dog is found. It will have a MP3 for listening to music. It will have a little computer which will search for people or places. The system can take pictures, too.

I would also use the GPS to help locate people who travel and may get lost. The President will have one of these GPS systems also and he will know that the people will need these systems. He will create one that people can afford and they will buy it in the store. The system will also help you to find food, if you are lost.
