

## THE PRESIDENT'S HELPER

By Nathan Kelley

If I were the Technology Assistant to the President of the United States, I would have United States scientists re-develop the Japanese Video and Camera Watches. The U.S. scientists would also develop laser watches and rocket boots for the Secret Service. The laser watches would be used to cut through iron bars and the rocket boots would be used to fly to places really fast. And then, there would be the Super Phone. Only the President has this phone. It has all of the phone numbers for the United States so he could send text messages or make phone calls to everyone at the same time if he has something important to tell everyone. For people that don't have a cell phone, a message will appear on their TV.

A robot will be developed to keep everything organized and keep everyone up-to-date. It would be called the M. O. M. which stands for Mechanical Organizing Machine. There would be another robot called the B. A. B., which stands for Building Assistance 'Bot. A robot called K. C. B., Kid Care 'Bot, is for when a President has children and it would take care and play with the President's children.

A final invention would be something called the "Knee Pad". It is used as a communication pad that you simply put your knee on and a hologram of the person you are talking to appears. The only way the hologram will appear is if the other person you are talking to has a knee pad as well.
