Technology use in the Future

If I worked for the President and my job was Technology Coordinator I would assign a group of our best inventors to invent what I call a plug. The plug would be the size of a quarter connected to a telephone line in my secret office. The President and all important people would carry the plug in their pockets at all times. The plug would only work by using their fingerprints. The plug would have different colors. The red button would be for a terrorist attack. As soon as the red button was pushed the President and all important people would know our nation was under attack. The plug would tell the President and all the important people the steps to take. Our President and important people would stop terrorists in their tracks and our nation would be safe. The black button would be to inform our President and important people about dangerous weather conditions. The black button would be pushed only when people needed to be moved out of their homes and into safer places. The orange button on the plug would be to inform The President and the important people about an outbreak of diseases so doctors could start to quarantine people right away and get the outbreak of diseases under control. The diseased people would have to stay home so the diseases could not be spread to other people. The telephone and the plug would be an excellent way to keep the President and the important people informed. This would keep the American people safe by stopping terrorists, warnings about dangerous weather conditions, and the outbreak of diseases.
